                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  member, of oligonucleotides and/or peptide nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation or cell or tissue types and for investigating cell differentiation. The method allows the method across the degree of cytosine methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Olek
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

CC The present invention describes an apoptosis-resistant virus-sensitive cell line into which an apoptosis resistance gene has been introduced. The recombinant viruses generated are capable of expressing apoptosis-capasic deepers. These can then be used in a variety of diseases for which the induction of apoptosis by gene transfer, or where the combinant viruses generated are capable of expressing apoptosis-capable of expressing apoptosis in this inventor for gene therapy that can be applied to cancer cell selectively, the treatment of capable of cartinate and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases, Prior arts have encountered the problem where if an adenovirus vector capable of cexpressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of time required to induce cell death by apoptosis is shorter than that combinant virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the

```
associated genes. These can then be used in a variety of diseases for which the induction of apoptosis by gene transfer, or where the inhibition of harmful apoptosis, is therapeutic. The recombinant viruses are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of autoimmune diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an adenovirus vector capable of expressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of time required to induce cell death by apoptosis is shorter than that required to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the plasmid pRx-Bcl-xl-bsr, which contains the human Bcl-xl gene, and
                                                                                                                                                                                                                                                                                                                                                                                                   cell line into which an apoptosis resistance gene has been introduced. The recombinant viruses generated are capable of expressing apoptosis-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New apoptosis-resistant virus-sensitive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20
       cell line into which an apoptosis resistance gene has been introduced. The recombinant viruses generated are capable of expressing apoptosis-associated genes. These can then be used in a variety of diseases for which the induction of apoptosis by gene transfer, or where the inhibition of harmful apoptosis, is therapeutic. The recombinant viruses are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of autoimmune diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an adenovirus vector capable of expressing an apoptosis associated gene is introduced into animal cells, the cells are cells to the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cowpox
                                                                                                                                                   The present invention describes an apoptosis-resistant virus-sensitive

CC cell line into which an apoptosis resistant virus-sensitive CC cell line into which an apoptosis resistance gene has been introduced. CC The recombinant viruses generated are capable of expressing apoptosis. CC associated genes. These can then be used in a variety of diseases for CC which the induction of apoptosis by gene transfer, or where the CC inhibition of harmful apoptosis, is therapeutic. The recombinant viruses CC are useful as vectors for gene therapy which can be applied to cancer CC therapy for destroying cancer cells selectively, the treatment of CC autoimmune diseases and graft rejection reaction, and apoptosis induction CC therapy for inflammatory cells in inflammatory diseases. Prior arts have CC encountered the problem where if an adenovirus vector capable of CC expressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of CC time required to induce cell death by apoptosis is shorter than that CC obtain a recombinant virus having the integrated apoptosis-associated GC gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant sequence represents the base sequence of the CC problem. The present sequence represents the base sequence of the CC plasmid pRx-Bcl 2-1-hCD 25, which contains the human Bcl-2 gene, and CC is used in an example from the present invention.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention. Sequence 6668 BP; 1329 A; 328 C; 1736 G; 3274 T; 1 other;

methylation of a particular cytosine in a motif 5'-CpG-3', present genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the geno DNA that contains the target C is amplified to form a labeled ampli The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide nucleic acid (PNA) oligo and the degree of hybridisation to both classes is determined from
                                                  This invention methylation of

label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. AB013410-AB054121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention

                                                                           Qy
                                                                                                                                                                                                                                                                                                                  This invention describes a novel method for determining the degree of CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert CC genomic sample of DNA. The sample is treated chemically to convert CC cytosine (C) but not methylated C, to uracil, then part of the genomic CC The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers CC and the degree of hybridisation to both classes is determined from the CC label on the amplicon. From the ratio of labels hybridised to the two CC classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of CC is used: (1) for diagnosis and/or prognosis of side effects of CC therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders CC systems etc., particularly by detecting mutations or single nucleotide contrains (SNP's); and (ii) for differentiation. The method allows the contraint of moteration of cell or tissue contraints of moterations of motific prognosis of side effects of contemporal contraints of mutations of cell or tissue contraints.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a nucleic acid comprising a sequence of 18 chases, of a segment of chemically pretreated NNA, (CP DNA) e.g. with Disases, of a segment of chemically pretreated NNA, (CP DNA) e.g. with CP bisulphite, of genes associated with tumour suppression and conceyenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences (Ss) and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may compared to a set of probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms and also to be used in an CR array for analysing diseases associated with CpG dinucleotides e.g. cancers and tumours. The probes can also be used in a method for CR array for analysing diseases or the predisposition to specific and/or therapy of existing diseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters, the

Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CpG dinucleotides in a sequence and therefore for analysing essociated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy

Designing primers and probes for analysing diseases associated cytosine methylation state e.g. arthritis, cancer, aging, carterioscierosis comprising fragments of chemically modified granterioted arthritis comprising fragments of chemically modified granterioted gra
